

## **ASSIGNMENT-2**

**NAME: ATCHAYA.B**

**REGISTER NUMBER: 811519106019**

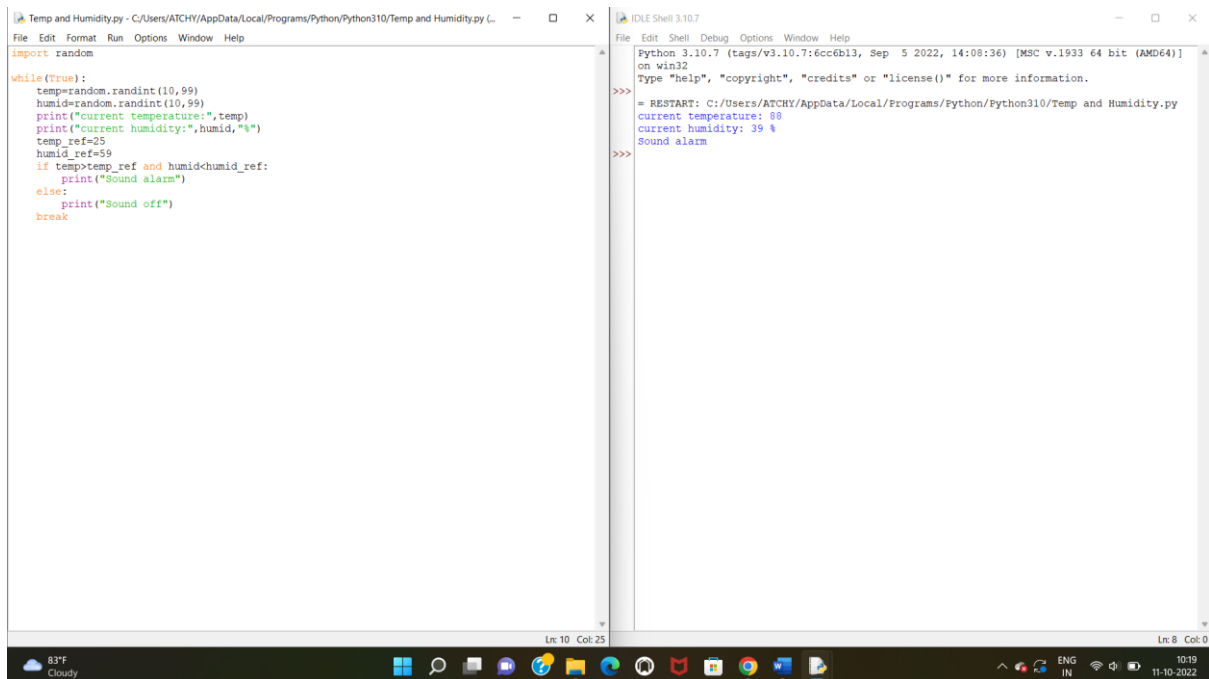

### **QUESTION:**

Build a python code, assume you get temperature and humidity values(generated with random function to a variable) and write a condition to continuously detect alarm in case of high temperature.

### **PROGRAM:**

```
import random
while(True):
    temp=random.randint(10,99)
    humid=random.randint(10,99)
    print("current temperature:",temp)
    print("current humidity:",humid,"% ")
    temp_ref=25
    humid_ref=59
    if temp>temp_ref and humid<humid_ref:
        print("Sound alarm")
    else:
        print("Sound off")
    break
```

# SCHEMATIC OUTPUT:

The image shows a screenshot of a Python IDE (IDLE Shell 3.10.7) running a script named 'Temp and Humidity.py'. The script is located at 'C:/Users/ATCHY/AppData/Local/Programs/Python/Python310/Temp and Humidity.py'. The script's logic is as follows:

```
import random

while(True):
    temp=random.randint(10,99)
    humid=random.randint(10,99)
    print("current temperature:",temp)
    print("current humidity:",humid,"%")
    temp_ref=25
    humid_ref=59
    if temp>temp_ref and humid>humid_ref:
        print("Sound alarm")
    else:
        print("Sound off")
    break
```

The output of the script, displayed in the IDLE Shell, is:

```
>>>
= RESTART: C:/Users/ATCHY/AppData/Local/Programs/Python/Python310/Temp and Humidity.py
current temperature: 88
current humidity: 39 %
Sound alarm
>>>
```

The Windows taskbar at the bottom shows the system clock as 10:19 on 11-10-2022, with a weather widget indicating 83°F and Cloudy conditions.
